

Satellite Systems and Content Acquisition

Satellite can help a team update, download, or communicate from remote places, but the local library should still work without it.

VillageServer Initiative printable field guide. Save this PDF on a phone, laptop, USB drive, or microSD card before travel.

Plain answer

Satellite is optional. It is helpful for updates and remote coordination, but it should not become the foundation. VillageServer is strongest when the local library works offline first.

Field steps

1. Decide if it is needed - Use satellite only when updates, coordination, or downloads cannot wait for normal internet.
2. Choose the location - Find open sky, stable ground, and a safe cable path.
3. Align and power - Set up the dish, connect power, and wait for the link to stabilize.
4. Download intentionally - Update only the resources needed for the mission, not random large files.
5. Return to offline mode - Make sure the local library still works after the satellite link is turned off.
6. Document the session - Write down what was updated and any connection problems.

Key points

Best use: Remote content updates, coordination, emergency communication, or proof-of-concept work.

Not required: The core library should still work without satellite.

Main risks: Power draw, sky view, weather, subscription cost, and setup complexity.

Board takeaway: Satellite is a bridge for updates, not the heart of the system.

Field habit: do one small test first. Open one file, confirm it works offline, then teach the next person to repeat it.
