

Computer to phone

Cable or LocalSend

No cloud upload required

USE THIS WHEN

A laptop holds the library and a phone needs a reliable field copy.

Follow these steps

01**Choose the method**

Use a data-capable USB cable for maximum reliability, or LocalSend when both devices share a network.

02**Unlock the phone**

Keep the phone awake. Android users choose File transfer when the USB prompt appears.

03**Open phone storage**

On Windows, use File Explorer. On Mac, use Finder for supported Apple transfers or LocalSend.

04**Copy a small test**

Copy one file into Downloads, Documents, or Files before moving a large folder.

05**Eject and verify**

Wait for copying to finish, safely eject when needed, then open the file offline.

SUCCESS CHECK

- The file size on the phone matches the source.
- The phone opens the resource after the cable or network is removed.

FIELD NOTE

Some cables provide power only. If the computer cannot see the phone, try a known data cable or LocalSend.
